* Although Photoshop is available for many platforms — from desktop computers to smartphones — I recommend that you buy a copy for your computer to take full advantage of its features. * Photoshop, like many image-editing programs, is designed to work in a Windows environment. Therefore, it's probably the most likely program to work on your computer. * To edit layers, have a look at the layers palette, which is the bottom-left area of the screen. The top-left part of the screen shows any active images. In the Layers palette, you should see any images, as well as the layers that you have created. * Photoshop allows you to create layers and add composite images that contain multiple layers. * When you save a file, the default is to create a separate file for each layer. However, you can save a single file, and even group a few layers in one file, which is called a `layer mask`. This feature is very useful for working on images and organizing complex projects. Here are some handy hints and tips that can help with starting up Photoshop: * Use the menus to access tools, features, and so on. * Display the Layers palette, shown in Figure 3-8. Use the tools at the top of the screen to create new layers or select existing layers. * If you're working with more than one image at a time, drag the top-left corner of the screen to snap the view to the active image. * When creating layers and importing them into Photoshop, you can use the Import Layers and Import Files options to automatically create any layers or files that you need. * The Undo feature allows you to undo changes in your image. Also, the Change Path tool works similarly, but changes the overall shape of your image. * When you copy an image layer or a file, it has the same name as the original; if the original image is called `myimage.jpg`, the new image will have the same name as the original and then end in .jpg. If you change the name or type of your file, make sure that you save the new file. * You can activate layers by choosing Layer > Merge Visible, or using Layers > Merge Layers. **Figure 3-8:** The Layers palette enables you to work with layers. Q: Cancelling a Task that has been created in a thread I have a problem with cancelling a task when it's created inside a thread. I have the following scenario: I have a Java class that has a method that runs a task. The task should be run in a background thread (because the task can take a long time). The task is run by a ThreadPoolExecutor like this: final ThreadPoolExecutor executor = new ThreadPoolExecutor(1024, 1024, 0L, TimeUnit.MILLISECONDS, new LinkedBlockingQueue()); executor.execute(new Runnable() { public void run() { DoSomething(); } }); And DoSomething() is executed by: public void DoSomething(){ final Task t = new Task(); t.setName("myTask"); t.setPriority(Thread.MAX_PRIORITY); executor.execute(t); } When I try to cancel the task, it cannot be cancelled, but when I try to cancel it in DoSomething(), it works, so I think the problem is the thread has not finished, but somehow canceled by the GC. What I tried so far: t.setUncancellable() (works for cancel in run()), t.setUncancelled() (works for cancel in task) t.setCancellableFuture() (works for cancel in task) t.setCancelled() (returns false after run() has been called, no matter if I cancel or not) I also tried to put a System.gc() after the executor.execute() call, but no effect. I know that there are also executor.shutdown() but I don't want to shutdown the server, it should only shutdown if
